- Assembly Basics: Registers, operands, move
- Arithmetic & logical operations
- C, assembly, machine code

# Intel x86 Processors

- **Dominate laptop/desktop/server market**
- **Evolutionary design**
  - Backwards compatible up until 8086, introduced in 1978
  - Added more features as time goes on
    - Now 3 volumes, about 5,000 pages of documentation
- **Complex instruction set computer (CISC)**
  - Many different instructions with many different formats
    - But, only small subset encountered with Linux programs
  - Hard to match performance of Reduced Instruction Set Computers (RISC)
  - But, Intel has done just that!
    - In terms of speed. Less so for low power.

# x86 Clones: Advanced Micro Devices (AMD)

## ■ Historically

- AMD has followed just behind Intel
- A little bit slower, a lot cheaper

## ■ Then

- Recruited top circuit designers from Digital Equipment Corp. and other downward trending companies
- Built Opteron: tough competitor to Pentium 4
- Developed x86-64, their own extension to 64 bits

## ■ Recent Years

- Intel got its act together
  - 1995-2011: Lead semiconductor “fab” in world
  - 2018: #2 largest by \$\$ (#1 is Samsung)
  - 2019: reclaimed #1
- AMD fell behind: Spun off GlobalFoundries
- 2019-20: Pulled ahead! Used TSMC for part of fab
- 2022: Intel re-took the lead

# Intel's 64-Bit History

- **2001: Intel Attempts Radical Shift from IA32 to IA64**
  - Totally different architecture (Itanium)
  - Executes IA32 code only as legacy
  - Performance disappointing
- **2003: AMD Steps in with Evolutionary Solution**
  - x86-64 (now called “AMD64”)
- **Intel Felt Obligated to Focus on IA64**
  - Hard to admit mistake or that AMD is better
- **2004: Intel Announces EM64T extension to IA32**
  - Extended Memory 64-bit Technology
  - Almost identical to x86-64!
- **All but low-end x86 processors support x86-64**
  - But, lots of code still runs in 32-bit mode

# Our Coverage

# Definitions

- **Architecture:** (also ISA: instruction set architecture) The parts of a processor design that one needs to understand for writing assembly/machine code.
  - Examples: instruction set specification, registers
- **Microarchitecture: Implementation of the architecture**
  - Examples: cache sizes and core frequency
- **Code Forms:**
  - **Machine Code:** The byte-level programs that a processor executes

  - RISC V: New open-source ISA

# Assembly/Machine Code View

## Programmer-Visible State

### ■ PC: Program counter

- Address of next instruction
- Called “RIP” (x86-64)

### ■ Register file

- Heavily used program data

### ■ Condition codes

- Store status information about most recent arithmetic or logical operation
- Used for conditional branching

### ■ Memory

- Byte addressable array
- Code and user data
- Stack to support procedures

# Assembly: Data Types

- **“Integer” data of 1, 2, 4, or 8 bytes**
  - Data values
  - Addresses (untyped pointers)
- **Floating point data of 4, 8, or 10 bytes**
- **(SIMD vector data types of 8, 16, 32 or 64 bytes)**
- **Code: Byte sequences encoding series of instructions**
- **No aggregate types such as arrays or structures**
  - Just contiguously allocated bytes in memory

# Assembly: Data Types

- “Integer” data of 1, 2, 4, or 8 bytes

- Data values
- Addresses (untyped pointers)

Register names

```
addq  %rbx, %rax
```

is

rax += rbx

These are 64-bit registers, so we know this is a 64-bit add

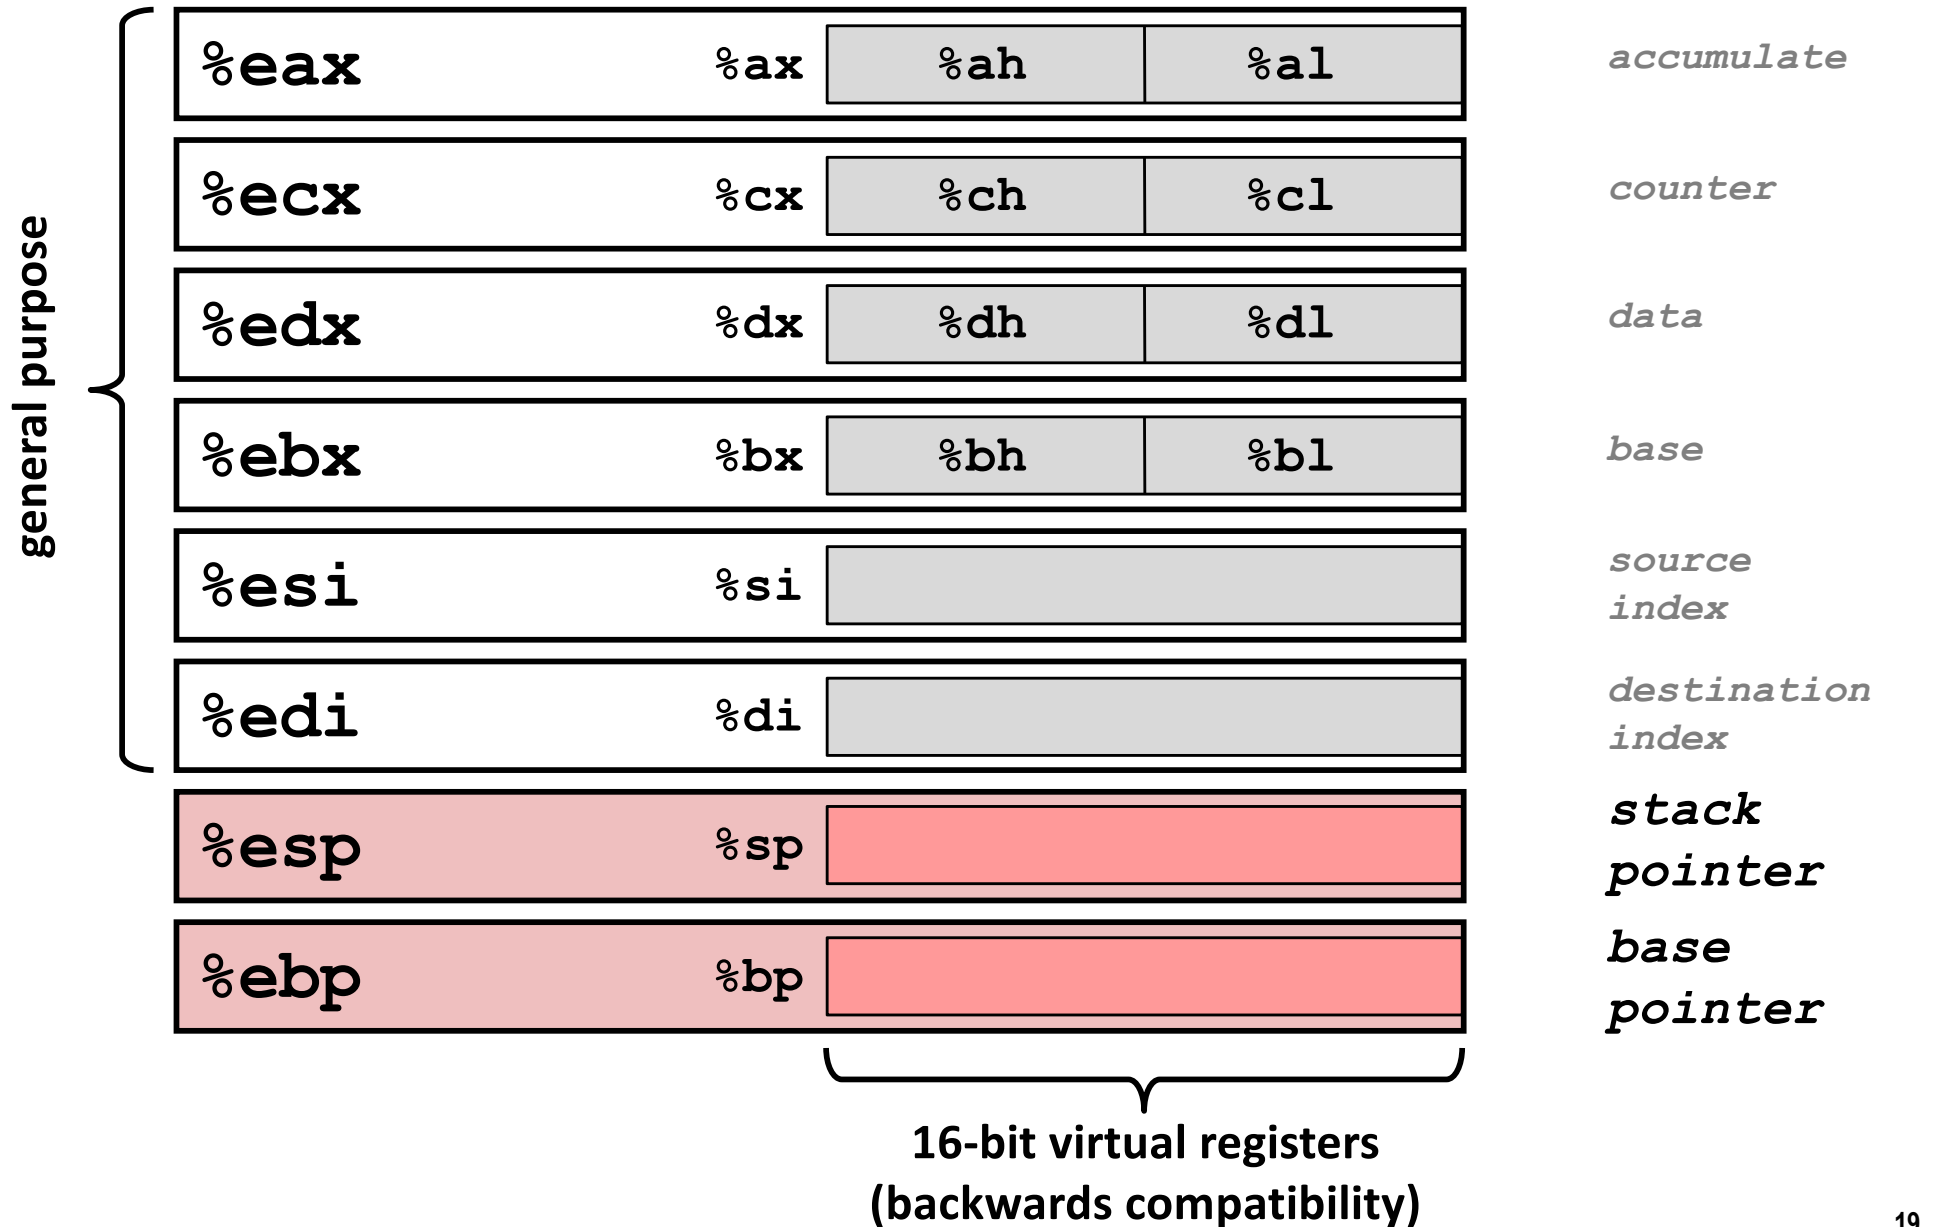

# x86-64 Integer Registers

# Some History: IA32 Registers

# Assembly: Operations

- **Transfer data between memory and register**
  - Load data from memory into register
  - Store register data into memory

  - Indirect branches

# Moving Data

## ■ Moving Data

`movq Source, Dest`

## ■ Operand Types

- **Immediate:** Constant integer data
  - Example: `$0x400`, `$-533`
  - Like C constant, but prefixed with ``$'`
  - Encoded with 1, 2, or 4 bytes
- **Register:** One of 16 integer registers
  - Example: `%rax`, `%r13`
  - But `%rsp` reserved for special use
  - Others have special uses for particular instructions
- **Memory** 8 consecutive bytes of memory at address given by register
  - Simplest example: `(%rax)`
  - Various other “addressing modes”

`%rax`

`%rcx`

`%rdx`

`%rbx`

`%rsi`

`%rdi`

`%rsp`

`%rbp`

`%rN`

**Warning: Intel docs use  
`mov Dest, Source`**

# movq Operand Combinations

# Address Computation Instruction

## ■ `leaq Src, Dst`

- Src is address mode expression
- Set Dst to address denoted by expression

## ■ Uses

- Computing addresses without a memory reference
  - E.g., translation of `p = &x[i];`
- Computing arithmetic expressions of the form  $x + k*y$ 
  - $k = 1, 2, 4, \text{ or } 8$

## ■ Example

```
long m12(long x)
{
    return x*12;
}
```

### Converted to ASM by compiler:

```
leaq (%rdi,%rdi,2), %rax    # t = x+2*x
salq $2, %rax               # return t<<2
```

# Some Arithmetic Operations

## ■ Two Operand Instructions:

### Format

### Computation

<code>addq</code>	<code>Src, Dest</code>	<code>Dest = Dest + Src</code>
<code>subq</code>	<code>Src, Dest</code>	<code>Dest = Dest - Src</code>
<code>imulq</code>	<code>Src, Dest</code>	<code>Dest = Dest * Src</code>
<code>salq</code>	<code>Src, Dest</code>	<code>Dest = Dest &lt;&lt; Src</code>
<code>sarq</code>	<code>Src, Dest</code>	<code>Dest = Dest &gt;&gt; Src</code>
<code>shrq</code>	<code>Src, Dest</code>	<code>Dest = Dest &gt;&gt; Src</code>
<code>xorq</code>	<code>Src, Dest</code>	<code>Dest = Dest ^ Src</code>
<code>andq</code>	<code>Src, Dest</code>	<code>Dest = Dest &amp; Src</code>
<code>orq</code>	<code>Src, Dest</code>	<code>Dest = Dest   Src</code>

Also called `shlq`

Arithmetic

Logical

- Watch out for argument order! *Src, Dest*  
(Warning: Intel docs use “op *Dest, Src*”)

- No distinction between signed and unsigned int (why?)

# Some Arithmetic Operations

## ■ One Operand Instructions

<code>incq</code>	<code>Dest</code>	$\text{Dest} = \text{Dest} + 1$
<code>decq</code>	<code>Dest</code>	$\text{Dest} = \text{Dest} - 1$
<code>negq</code>	<code>Dest</code>	$\text{Dest} = -\text{Dest}$
<code>notq</code>	<code>Dest</code>	$\text{Dest} = \sim\text{Dest}$

## ■ See book for more instructions

# Arithmetic Expression Example

```
long arith
(long x, long y, long z)
{
    long t1 = x+y;
    long t2 = z+t1;
    long t3 = x+4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}
```

arith:

```
leaq    (%rdi,%rsi), %rax
addq    %rdx, %rax
leaq    (%rsi,%rsi,2), %rdx
salq    $4, %rdx
leaq    4(%rdi,%rdx), %rcx
imulq   %rcx, %rax
ret
```

## Interesting Instructions

- **leaq**: address computation
- **salq**: shift
- **imulq**: multiplication
  - But, only used once

    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}
```

arith:

```
leaq    (%rdi,%rsi), %rax    # t1
addq    %rdx, %rax          # t2
leaq    (%rsi,%rsi,2), %rdx
salq    $4, %rdx            # t4
leaq    4(%rdi,%rdx), %rcx   # t5
imulq   %rcx, %rax          # rval

- **Total of 14 bytes**

- **Each instruction  
1, 3, or 5 bytes**

- **Starts at address  
0x0400595**

## ■ Assembler

- Translates `.s` into `.o`
- Binary encoding of each instruction
- Nearly-complete image of executable code
- Missing linkages between code in different files

## ■ Linker

- Resolves references between files
- Combines with static run-time libraries
  - E.g., code for **`malloc`**, **`printf`**
- Some libraries are *dynamically linked*
  - Linking occurs when program begins execution

# Machine Instruction Example

```
*dest = t;
```

```
movq %rax, (%rbx)
```

```

## ■ C Code

- Store value `t` where designated by `dest`

## ■ Assembly

- Move 8-byte value to memory
  - Quad words in x86-64 parlance
- Operands:
  - `t:` Register `%rax`
  - `dest:` Register `%rbx`
  - `*dest:` Memory `M[%rbx]`

## ■ Object Code

- 3-byte instruction

## ■ Disassembler

`objdump -d sum`

- Useful tool for examining object code
- Analyzes bit pattern of series of instructions
- Produces approximate rendition of assembly code
- Can be run on either a `.out` (complete executable) or `.o` file
